## Chapter 1

### Project Description –*Discover your path: Cit Chennai*.

#### Introduction:

This website is designed to provide information about the college, its courses, location, and other important details. The website will also include a login page for students and faculty members.

#### Website Features

##### 1. Home page:

The home page of the college website provides an overview of the college's facilities and services to prospective students and visitors.

The facilities section highlights the college's facilities, such as the library, computer labs, sports facilities, cafeteria, and student services. This section includes images and brief descriptions of each facility, highlighting their importance and benefits to students. The last section is the testimonials section that shows two testimonials from students. Each testimonial includes a message, the name of the student, and a rating system that uses fontawesome stars.

The website footer contains links to the college's social media pages, including Instagram, Facebook, and Twitter. These icons are displayed prominently at the bottom of the page, and clicking on them redirects the user to the respective social media page.

Here is a breakdown of the CSS properties used in this code:

1.flex-direction: This property sets the direction of the flexible items within a flex container. In this case, it sets the direction of the input-group class to column, which displays the input fields vertically.

1.background: This property sets the background image or color of an element. In this case, it is used to set a linear gradient as well as an image as the background of the body.

2.border-color: This property sets the color of an element's border. In this case, it sets the border color of an input field to red or green depending on whether there is an error or not.

3.background-color: This property sets the background color of an element. In this case, it sets the background color of the form to whitesmoke.

4.display: This property sets the display behavior of an element. In this case, it sets the display of the input-group class to flex.

5.background-attachment: This property sets whether the background image is fixed or scrolls with the page. In this case, it is set to fixed so that the background image doesn't move as the user scrolls.

## **2. Login Page:**

The website should have a login page for students and faculty members. Users should be able to log in using their username and password.

This page also enables the user to create a new account. The form has five input fields: First Name, Last Name, Email ID, Password, and Confirm Password. The form also has a Register button to submit the form .When the user submit, it automatically redirect into the home page.

It checks for the presence of the required input fields and also ensures that the user provides a valid email address, password with minimum of 8 characters, and that the confirm password matches the password.

The JavaScript code is defined in a separate file named "login.js," which is linked to the HTML document using the script tag in the head section. The script defines a function named "validateInputs()" that is called when the form is submitted. The

function performs some basic validation on the email and password fields to ensure they are not empty. If either of the fields is empty, an error message is displayed below the field using the div element with the class "error."

#### Obtaining Form and Input Elements:

The code starts by obtaining the form element using `document.querySelector('#form')` and input elements for firstname, lastname, email, password, and compass using `document.querySelector('#firstname')` etc. This is done to get their values and check for errors.

#### Event Listener for Submit:

The code adds an event listener for the form using `form.addEventListener('submit',(e)=>{...})`. When the user submits the form, the code calls `validateInputs()` to check for errors.

#### Validate Inputs Function:

The `validateInputs()` function obtains the values of the input elements and checks them against the required fields. It returns a boolean variable that indicates whether all required fields have been filled and are error-free.

#### Set Error Function:

The `setError()` function is used to add an error message to an input element. It adds a class 'error' to the input element's parent element and sets the error message text to the 'error' element. It is used by `validateInputs()` to display error messages.

#### Set Success Function:

The `setSuccess()` function is used to remove error messages from an input element. It adds a class 'success' to the input element's parent element, which indicates that the input is valid. It is also used by `validateInputs()` to remove error messages.

#### Email Validation:

The `validateEmail()` function uses a regular expression to check whether the email is in a valid format. It is called by `validateInputs()` to validate the email input.

#### Form Submission:

If all the inputs are valid, `validateInputs()` sets the input elements' class to 'success', and the form is submitted, and the user is alerted that the registration is successful.

### 3. Courses:

The website provides the information about the courses offered by the college. It includes details such as course and its descriptions.

### 4. Location:

The website provides information about the location of the college. It includes the address, directions, and a map.

The code includes an embedded Google Maps iframe that displays the location of the campus. The iframe includes the necessary source URL, width, height, and referrer policy attributes.
